DETAILED ACTION

Allowable Subject Matter

Claims 1-11, 15 and 16 are allowed.

Regarding independent claims 1, 9 and 10, the closest prior art to the instant invention is Lowe (USP 6,077,002). LOWE teaches a method of producing from a workpiece, a finished disc in a disc assembly, for a gas turbine engine, the workpiece having a hub (12) and a disc extending radially outwardly from the hub portion (12) which forms a support surface ('002, figure 1, Col. 3, lines 39-49). LOWE teaches in figures 1 & 2, end mill/tool (22) having access to both axial faces of the disc during machining. LOWE also teaches in figure 2, the step milling process by alternately repeating the groove and sidewall cutting by end mill (22) (i.e. performing a sequence of machining operations alternately on opposite sides of the disc), to form a corresponding pocket (30) along which the sidewall (28) extends ('002, figure 2 and Col. 4, lines 23-33). However, regarding claim 1, Lowe fails to anticipate or make obvious the machining operations being turning operations conducted on a lathe. Furthermore, regarding claim 9, Lowe fails to anticipate or make obvious at least one of the machining operations being delayed after completion of the immediately preceding machining operation, until distortion resulting from the immediately preceding machining operation has taken effect. Regarding claim 10, Lowe fails to anticipate or make obvious finish machining operations taking place after all rough and semifinish machining operations on both axial faces of the disc have been completed.
